THE FUTURE OF LINEN MANAGEMENT—RFID TRACKING WITH INTELLIGENT SOFTWARE FROM R.W. MARTIN COMPANY AND ABG SYSTEMS

Linen loss hurts your bottom line. So does a lack of traceability when linens disappear.

The solution? A comprehensive system that enables you to definitively track every item to the last responsible party.

RFID is that solution.

With RFID technology from R.W. Martin Company and ABG Systems, you get specialized textile-tracking solutions combined with intelligent tracking software that will give you complete control over your entire inventory.

THE BENEFITS OF RFID TRACKING AND MONITORING

RFID, or radio frequency identification, involves the insertion of a passive electronic device into a textile or other item. This embedded RFID tag gives the item a unique, scannable identity. Because the RFID tag can withstand the industrial-laundrying process, this allows you to reliably track it as it moves through its usage cycle again and again.

Superior Inventory Management and Full Accountability

Our RFID system will provide a clear picture of your inventory status. With RFID tracking, you'll know what's

in-house and what's at a customer's site, and you'll know when an item went out and when it came back in. You'll also be able to track static inventory as well as the number of wash cycles for each item.

Reduced Labor Costs and Less Manual Processing

A properly designed RFID-tracking system enables bulk scanning at multiple points throughout your facility to ensure accurate information. With RFID, there's no need to handle textiles manually or deal with individual line-of-sight barcode scanning when they go in or out.

UNRIVALED DATA COLLECTION AND VISIONARY INVENTORY FORECASTING

Our RFID-based monitoring solution is driven by proprietary, intelligent management software known as ONE.

With ONE, you'll have a complete picture of your inventory from a central dashboard that indicates the status of every RFID-tagged item. ONE gives you easy access to this information as well, allowing you to obtain real-time data on every inventory item via a PC, a tablet, or a smartphone.

Using ONE's powerful reporting tool, you can analyze all the inventory data generated during your entire logistic process. This not only includes the number of times an item has gone through a usage cycle, but also its repair history, creating a valuable data repository.

With this information, you'll be able to better predict the number of times an item of this type can circulate before you'll need to replace it.

But this just scratches the surface of ONE's predictive capabilities.

ONE is an investment in your future. With the historical data compiled by ONE at your fingertips 24/7, you'll be able to identify broader circulation trends that will help you better manage your textile stocking and ordering moving forward.

TRACK ALL YOUR ASSETS

You can use RFID to track any circulating textile: uniforms, medical scrubs, lab coats, gowns, towels, bedsheets, pillowcases, tablecloths, curtains, and more.

But RFID isn't just for textile management. Keep track of other valuable assets too—from shoes, mats and microfiber mops to slings, medical kits, and surgical tools.

DECADES OF EXPERIENCE

R.W. Martin Company has served the needs of the industrial laundry industry for more than 50 years, providing equipment, parts, service and technical support.

ABG Systems is a global leader in RFID textile tracking, serving customers across 23 countries with more than 700 installations.

Protect your assets, increase your efficiency, and serve your customers better with a smarter linen-management system.

BELOW: Control your inventory 24/7 from a PC, tablet, or smartphone with the ONE Management Software.

Together, R.W. Martin and ABG will design a comprehensive solution customized to meet your operation's exact needs.

Start the journey to your RFID future. Call us today. 

ONE Management Software

Verify the status of every RFID-tagged item in real time

Know exactly when any item went out and when it came back in

View historical usage and repair data for every item

Generate a range of customized reports

Utilize data to help predict any item's lifespan

Optimize inventory management by analyzing historical data
